Executive Summary

SITE: Area 2 Site Q

LOCATION: 70 Cargill Elevator Road
Cahokia, Illinois 62206

PROJECT DATES: October 18, 1999 to April 19, 2000

INCIDENT DESCRIPTION: Area 2 Site Q (Site Q) is an inactive industrial and municipal waste disposal area encompassing approximately 90 acres. Site Q was used as a waste disposal area for industrial and municipal wastes between the years of 1966 and 1973 and was operated by Sauget and Company. Site Q is located in west-central St. Clair County, Illinois adjacent to the Mississippi River in the towns of Cahokia and Sauget. The release of hazardous substances at Site Q was from the deliberate burial of wastes (drums, containers, and bulk waste). During previous investigations conducted by the Illinois Environmental Protection Agency and the U.S. Environmental Protection Agency wastes and soils on site were found to be contaminated with high levels of polychlorinated biphenyls (PCBs) and heavy metals (particularly arsenic, lead, chromium, mercury, and cadmium). The site is located on the river side of a flood control levee constructed by the U.S. Army Corps of Engineers. Due to its location, the site is highly vulnerable to flooding from the adjacent Mississippi River. Access to the site is unrestricted and local residents use the site for fishing, hunting and off-road motorcycling. The removal action was undertaken to mitigate threats to the public health and environment posed by the presence of drums at the surface, the possibility of drums beneath the surface, and contaminated soils.

ACTIONS: The United States Environmental Protection Agency (U.S. EPA) initiated this removal action on October 18, 1999. The ERRS contractor began to excavate site wastes on October 26, 1999. Eight excavation areas of various sizes were investigated and have had waste removed. This removal action addressed approximately 25-acres of site property. Based upon analytical results of the separate waste piles, two waste streams were developed. A low level PCB waste stream (soil < 50 ppm) was shipped via truck to the Milam Recycling and Disposal Facility located in East St. Louis, Illinois. One hundred sixty three trucks, each containing approximately 20 tons of low level PCB waste were shipped to the disposal facility. A PCB waste stream (soil/debris containing > 50 ppm of PCBs) was shipped via rail car to the Safety-Kleen Lone & Grassy Mountain facility, located in Waynoka, Oklahoma. One hundred forty one rail cars, each containing approximately 90 tons of PCB waste were shipped to the disposal facility. Drums (3,271) excavated on site have been crushed and added to either waste stream. Excavated drums that were void of waste material were added to either PCB waste stream; and drums that contained waste were added to the > 50 ppm PCB waste stream. On April 5, 2000, removal of site wastes was completed (approximately 17,032 tons of waste was removed from site). Drums/containers with distinguishing marks and labels have been documented and were added to the PCB waste stream or archived for future investigations. On April 13 and 17, 2000, the START contractor collected 24 subsurface soil samples in former excavation areas to determine concentrations of PCBs that remain in soils. Samples were collected below cover material in areas where drums and/or bulk wastes were removed. Analytical results of several of these samples indicate that concentrations of PCBs in site soils exceeds the removal action limit of 50 ppm. Due to lack of

topsoil needed to completely cap the excavation areas, municipal waste is visible on the limited portions of the site. Due to limited resources and the amount of contamination this removal action could not address all the contamination present on the site.

I. SUMMARY OF EVENTS

A. Site Conditions and Background

1. Initial Situation

Area 2 Site Q (Site Q) is part of the Sauget Area sites that consist of several municipal and industrial waste landfills; surface disposal areas; and past excavation areas suspected to be filled or partially filled with unknown industrial wastes. The entire Sauget Site area is divided into Area 1 and Area 2. Sauget Area 2 is made up of five waste disposal areas (Sites O, P, Q, R, S). Sauget Area 2 is not listed on the NPL; however, listing activities are now underway. Site Q occupies 90 acres and was actively used as a waste disposal area by Sauget and Company for industrial and municipal wastes from the mid 1950's to 1973. Most of Site Q is presently owned by Eagle Marine Industries, Inc. of St. Louis, Missouri.

Site Q is located in west-central St. Clair County, Illinois adjacent to the Mississippi River (latitude 38°34'93.5" N, longitude 90°12'0.6" W) in the towns of Cahokia and Sauget. Across the river lies the city of St. Louis, Missouri. A site location map is included in Attachment A. The site is bordered by Site R and the Old Sauget Power Plant on the north; the United States Corps of Engineers (U.S. COE) flood control levee on the east; agricultural land on the south; and the Mississippi River on the west. A railroad spur divides the site, running northeast from Cargill Elevator Road to the northern one-third of the property. The area of interest for this removal action consists of the area east and south of the railroad spur, north of Cargill Elevator Road. During this removal action, approximately 25 acres of contamination were addressed. A site features map, completed by the United States Environmental Protection Agency (U.S. EPA) Fields Team, is included in Attachment A. An underground 14-inch, high pressure petroleum products Explorer pipeline lies along the western edge of the area of interest. The area of interest contains four ponds (north, south, east, and west) that are filled with water during various times of the year or during flooding. The nearest resident is located approximately 0.75 mile southeast of the site. Local residents use the ponds for fishing, hunting, and off-road motorcycling. The site contains evidence of trespassing (i.e., spent ammunition casings, and evidence of recreational vehicle use).

A number of investigations have taken place at Site Q. In June 1983, as a result of finding buried drums at the northern section of the site, a U.S. EPA Field Investigation Team (FIT) contractor collected 33 subsurface soil samples at the site. A total of 63 of 112 organic compounds from the priority pollutant list were detected. In October of 1984, Illinois Environmental Protection Agency (Illinois EPA) personnel conducted inspections to determine the scope of proposed cleanup work at the site. In March of 1985, the Illinois Attorney General's office reentered a suit against Sauget and Company, ordering a final cover over the site and requesting a civil penalty. As part of an Expanded Site Investigation conducted by Illinois EPA in March of 1987, a monitoring well was installed in the pond area of Site Q (well No. EE-09). A sample

collected from this well showed the presence of benzene at 1J parts per billion (ppb; J=estimated value), chlorobenzene (33 ppb), and di-n-octyl phthalate (4J ppb). As a result of severe flooding on the Mississippi River in the summer of 1993, waste materials including drums were left exposed along the shoreline side of Site Q. In May 1994, samples collected by the U.S. EPA Technical Assistance Team (TAT) contractor, Ecology and Environment Inc. (E & E), detected semivolatile organic compounds and polychlorinated biphenyls (PCBs) from the exposed wastes. One sample contained 260,000 parts per million (ppm) of PCBs. Illinois EPA collected 11 surface soil and waste samples from the east and west ponds in Site Q in November 1994. Analytical results of samples indicated the presence of heavy metals, arsenic (216 ppm), lead (195,000 ppm), and mercury (4.9 ppm). PCBs were also detected at concentrations as high as 223,000 ppb. In 1995, a removal action was conducted by U.S. EPA to remove the waste materials (including exposed drums from the banks of the Mississippi River) and repair the exposed sections of the fill area.

In August 1997, E & E completed a Preliminary Ecological Risk Assessment for the U.S. EPA to evaluate the risks to local wildlife from contamination from the area. The Preliminary Ecological Risk Assessment concluded that elevated concentrations of cadmium, chromium, lead, mercury, and PCBs could decrease species diversity of the area including sensitive species. Heavy metals and PCBs detected on site could also bioconcentrate in fish tissue at high levels. Local fisherman who use the site and consume their catch could be exposed to the high levels of metals and PCBs.

The primary drinking water source for nearby residences is from a water intake along the Mississippi River, located approximately 3 miles north of the site. Groundwater flow is primarily towards the southwest towards the Mississippi River. At least 50 residents in the area obtain drinking water from private wells. The nearest drinking water well is located on Judith Lane, approximately 1 mile east of Site Q. More than eight industrial wells are located within a 3-mile radius of the site. The land surrounding the site is primarily used for agricultural and industrial purposes. Commercial activities are located northeast of the site.

The surface of Site Q is littered with demolition debris, metal wastes, and areas of exposed drums. Surface runoff at the area of interest is primarily toward the four ponds. During the summer of 1993, flood waters from the Mississippi River inundated the entire site. The site is vulnerable to erosion and scouring during flooding because it lies on the river side of the flood control levee.

2. Location of hazardous substance(s)

Bulk waste, contaminated soil, and/or drums were found in eight excavation areas during the removal action. 3,271 drums were removed from the site; the drums contained solvents, paint waste, solidified material, containers, and other various wastes. Miscellaneous containers and medical waste (hypodermic needles) were also documented on site. Additional areas of known contamination or drum burial areas are present on site as well. Drums are visibly protruding from the ground north of the

northwest corner of the site. On-site areas have been excavated based upon visual observations, discussions with witnesses, aerial photographs, and results of surveys with a magnetic locator. On April 13, 2000, the U.S. EPA Fields Team mapped site features using a global positioning system. A map showing removal areas is included in Attachment A. Environmental Restoration (ER) excavated 2 drums from Area A, over 500 from Area 1, over 50 from Area 2, over 300 from Area 3, 454 from Area 4, no drums from Area 5, 1,165 from Area 6, 690 from Area 7, and 92 from Area 8. The four on-site ponds remained dry during the removal action.

3. Cause of the release or discharge

The release of hazardous substances at Site Q was from the deliberate burial of wastes (drums, containers, and bulk waste). Waste was buried in unlined pits and found at and below ground surface. Waste was exposed to groundwater, surface water, and/or air. Over time, buried drums and miscellaneous containers were exposed to varying seasonal temperatures (freeze/thaw), rain, periodic flooding, and snowmelt. These weather conditions resulted in further deterioration of the drums, erosion of surrounding soils, and the continued release of hazardous wastes described herein to the surrounding soil, surface water, and groundwater.

4. Efforts to locate and obtain response by responsible parties

U.S. EPA is investigating Site Q and may initiate cost recovery actions.

B. Organization of the Response

The U.S. EPA removal action began on October 18, 1999. The removal action was conducted in four phases: site setup; waste excavation and sampling; removal and disposal of waste; and pit backfilling, grading, seeding and site demobilization.

Under Contract Number 68-S5-98-01, Delivery Order 9801-05-047, removal activities were awarded to the U.S. EPA Emergency and Rapid Response Services (ERRS) contractor, Environmental Quality Management (EQM), with subcontractor work provided by ER. The actions described in this report were performed by U.S. EPA under authority and funding of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and were completed on April 19, 2000. Attachment B, Table 1 outlines the agencies or parties that provided response, assessment or disposal assistance, and the action(s) and roles each served during the Site Q removal action.

C. Injury or Possible Injury to Natural Resources

1. Content and time of notice to natural resource trustees

The Preliminary Ecological Risk Assessment, completed by E & E in August of 1997, concluded that elevated concentrations of cadmium, chromium, lead, mercury, and PCBs could decrease the species diversity of the area including sensitive species.

Heavy metals and PCBs detected on site could also bioconcentrate in fish tissue at high levels. Local fisherman who use the site and consume their catch could be exposed to high levels of metals and PCBs. During the removal action white-tail deer (*Odocoileus virginianus*) and coyotes (*canis latrans*) were seen on site, while bald eagles (*Haliaeetus leucocephalus*) were seen flying above the site. Natural resource trustees were periodically updated about the U.S. EPA removal action.

2. Trustee damage assessment and restoration activities

No formal damage assessment has been conducted.

D. Chronological Narrative of Removal Activities

1. Threat abatement actions taken

The removal action at Site Q was conducted under the authority of CERCLA Section 104(a). On September 24, 1999, U.S. EPA Emergency Response Branch (ERB) approved the expenditure of up to \$2.4 million dollars to complete a removal action at Site Q. The removal action was undertaken to mitigate threats to the public health and environment. U.S. EPA mobilized ERRS under Contract Number 68-S5-98-01, Delivery Order 9801-05-047 and START under Technical Direction Document S05-9909-015. 3,271 drums and 17,032 tons of soil were excavated from the site. 13,772 tons of soil were profiled as a PCB waste, and 3,260 tons of soil were profiled as a low level PCB waste. Approximately 5,400 tons of soil were treated with Enviroblend to bind leachable lead. Drums/containers with distinguishing marks and labels were documented or archived for future investigations.

OCTOBER 1999

On October 18, 1999 ERRS and START mobilized to the site. During the week, ERRS prepped the site by removing weeds and obstacles for the site trailers, brush cut pathways around the site for access, and made entryways down into the two ponds. A storage/break trailer and office trailer arrived on site. On October 25, 1999, OSC Turner, START, ERRS contractor EQM and their subcontractor ER mobilized to the site to begin removal field work. A health and safety plan was prepared by START and reviewed by all site personnel. Excavations began at the southern end of the roadway that divides the two ponds (Area A). Aerial photos had indicated that waste was placed along this roadway, and visual observations confirmed waste at the surface. On October 27 and 29, 1999, START collected six surface soil samples (SS-01, SS-02, SS-03, SS-04, SS-05, and SS-06) and two subsurface soil samples (SB-01 and SB-02) within the west pond. Samples SB-01 and SB-02 were collected at sample SS-02 and SS-03 locations, respectively. Samples collected, dates sampled, and analysis performed during the removal action are summarized on Attachment B, Table 2. Analytical results of samples SS-01 through SS-06, and SB-01 and SB-02 are presented in Attachment B, Table 3. Analytical results indicate the presence of metals, semivolatile organic compounds (SVOCs), and PCBs in the samples. Sample SB-02 contained 7.15 milligrams per liter (mg/L) of toxicity characteristic leaching procedure

(TCLP) lead, sample SB-01 contained 270 mg/kg of benzo(a)anthracene, 813 mg/kg of benzo(a)pyrene, and 260 mg/kg of benzo(g,h,i)perylene. Aroclor 1254 and 1260 were detected in all eight soil samples with a maximum total PCB concentration of 3,150 micrograms per kilogram ($\mu\text{g/kg}$) detected in sample SB-01.

ER encountered drum carcasses at depth on the west side of the area between the east and west ponds. START performed Chlor-n-soil PCB screening tests along the area. Three of seven samples indicated PCBs present at concentrations exceeding 50 ppm. Due to the elevated PCB concentrations, excavation was stopped along the roadway. Excavation activities continued in the east pond (Area 1). During the early stages of the removal, drums were individually numbered. However, due to the number of drums excavated, ER ceased numbering individual drums. Many of the drums excavated from the site were severely deteriorated. Excavated drums were empty or filled with solids, liquids and/or earthen material. On October 29, 1999, START collected samples Drum-01 and Drum-02, that consisted of waste material from two separate drums being deposited into the soil. Analytical results of drum samples are summarized in Attachment B, Table 4. ER visually screened and segregated the excavated material. START performed hazard categorization (hazcat) tests to determine if excavated material contained hazardous constituents. Based upon the results or project limitations, the material was either added to waste piles for off-site disposal or backfilled in the excavation pits. During the course of the removal action, drums were stored on a plastic liner. Drums/containers with distinguishing marks and labels were documented and/or archived for future investigations. Much of the excavation in Area 1 was conducted in Level B personal protective equipment (PPE). Based upon discussions with OSC Turner, START, RM Davis, and ERRS health and safety personnel, workers completed excavation activities in the remaining areas in level C PPE providing breakthrough on cartridges did not occur.

NOVEMBER 1999

ERRS continued excavating Area 1, and began excavation on Areas 2 and 3 within the east pond. By the end of the month, approximately 5,000 cubic yards of contaminated soil were excavated from the site. On November 18, 1999, ERRS excavated a ditch through the east pond to direct water from the excavation areas to the southeast portion of the pond. On November 3, 1999, START began to collect samples of waste material staged on site for waste characterization and disposal purposes. A list of waste piles, the area(s) where the waste material was excavated, and the dates the waste was shipped off site is presented in Attachment B, Table 5. Sample Pile-01 was a composite sample collected from waste piles 1 and 2. Analytical results of waste piles 1,2,3 and 8 are presented in Attachment B, Table 6. On November 10, 1999, START collected sample Pile-02, which was collected from waste material staged on site. On November 18, 1999, START collected sample Pile-02A and Pile-03. Sample Pile-02A was a composite sample collected from waste pile 2, sample Pile-03 was collected from waste pile 3. Analytical results indicate the waste material contained volatile organic compounds (VOCs), SVOCs, metals, pesticides, PCBs, and had a flashpoint below 140 degrees Fahrenheit ($^{\circ}\text{F}$). Analytical results indicate that waste piles 1 and 2 contained trichloroethene (TCE), lead, and PCBs above applicable regulatory levels. Samples

Pile-02 and Pile-02A contained TCLP TCE at 0.620 mg/L and 0.52 mg/L, respectively, which is above the regulatory level of 0.5 mg/L as defined by the 40 Code of Federal Regulations (CFR) 261. Samples Pile-02 and Pile-02A contained TCLP lead above the regulatory level of 5.0 mg/L as defined by the 40 CFR 261. Samples Pile-01, Pile-02, Pile-02A, and Pile-03 contained PCBs above the regulatory level of 50 ppm as defined in the 40 CFR 761. Disposal options of site wastes included incineration or treatment of the wastes on site to below TCLP parameters and disposal of waste at an approved landfill. The most cost-effective option was treatment of the waste piles with Enviroblend to bind leachable lead to levels below 5.0 mg/L.

Due to the site features (one access road on the site property), an alternate route for removal of site wastes was required. Disposal of site wastes was accomplished by staging site wastes to Alton and Southern Railroad property and loading the material onto gondola rail cars or by loading trucks on site property. The trucks required the use of Alton and Southern Railroad property to access and leave the site by entering the rail easement from the south and leaving the site from the rail easement on Cargill Elevator Road. ER obtained permission to use Alton and Southern Railroad property to transfer site wastes. On December 21, 1999, START collected seven composite surface soil samples (RS-01 through RS-07) on areas possibly impacted by the transfer of site wastes; sample results are located in Attachment B, Table 7. A map showing sample locations is presented in Attachment A. On January 3 and 4, 2000, ER built the access road to the rail spur, geofabric was placed along the road and covered with gravel. Transfer of site wastes required heavy equipment to cross the Explorer pipeline. On a letter dated November 18, 1999, Explorer Pipeline agreed to allow ER to cross the pipeline with heavy equipment providing ER used articulated trucks, and prior to crossing the pipeline ER installed 1-foot of soil, geofabric, and wooden mats across the entire 20-foot Explorer easement. ER complied with Explorer Pipeline's request during the removal action.

Based upon concentrations of lead in the waste material, ER collected eight lead air samples (AS-01 through AS-08) using Gillian pumps. Samples AS-01 through AS-04 were collected on November 19, 1999, while samples AS-05 through AS-08 were collected on November 20, 1999. Samples AS-04 and AS-08 were collected in the support zone, while the remainder were collected on ER crew members working in the excavation areas. Results of lead air sampling are presented in Attachment B, Table 8. Samples collected on site workers contained detectable concentrations of lead, while samples collected in the support zone did not. Crew members continued to work in Level C PPE.

ER and START collected samples Drum-03 (from drums 1-75), and sample Drum-04 (from drums 301-400). Sample material consisted of solid waste material, drums that contained liquid were not included in the samples. Analytical results of these drum samples are located in Attachment B, Table 4. Analytical results indicate the presence of VOCs, SVOCs, metals, and PCBs. Samples Drum-03 and Drum-04 contained 0.18 and 0.22J mg/L of TCLP benzene, 4.3 mg/L and 9.07 mg/L of TCLP cresols, 387 mg/L and 5.19 mg/L of TCLP lead, and 1,240 mg/kg and 2,780 mg/kg of total PCBs, respectively.

DECEMBER 1999

Approximately 865 drums and 8,300 cubic yards of material were excavated from the site by the end of December 1999. ER continued excavation of Areas 1 and 2 and began to excavate material in Area 4. START and ERRS inspected the drums that contained waste to determine the type of waste stream present. Seven different waste streams were identified. On December 2 and 6, 1999, START collected seven samples of individual drums excavated from site (drums 246, 102, 052, 112, 615, 775, 395). Each drum sample represented a distinct waste stream. Analytical results are presented in Attachment B, Table 4 with sample designations corresponding to individual drum numbers. Sample results indicate the presence of VOCs, SVOCs, metals, and PCBs. Methylene chloride was detected in six of the seven individual drum samples with a maximum concentration of 3,500 mg/kg detected in D-615. TCE was detected in five of the seven individual drum samples, with a maximum concentration of 17,000 mg/kg in D-112. Lead was detected in the seven individual drum samples with a maximum concentration of 3,110 mg/kg in D-102. PCBs were detected in the seven individual drum samples with a maximum concentration of 4,540 mg/kg of total PCBs detected in sample D-112. Six of the seven individual drum samples displayed a flashpoint below the regulatory level of 140 °F as defined by the 40 CFR 261.

On December 7, 1999, START collected two composite samples Density-01 and Density-02, from waste piles 1 and 2, respectively. Samples were collected to obtain the density of excavated material to determine the appropriate ratio of Enviroblend to waste material. Analytical results of Density-01 indicated that waste pile 1 had a density of 0.881 grams per centimeter cubed (g/m^3), and waste pile 2 had a density of 0.995 g/m^3 . A 3% blend was calculated to bind lead to pass TCLP. Treatment of waste piles commenced on December 7, 1999, and was completed on December 20, 1999. Waste piles 1,2,4,5 were treated with Enviroblend. Attachment B, Table 9 presents data regarding the treated waste piles, dates the piles were treated, piles sampled, and sample designations. Analytical results of blend piles sampled are presented in Attachment B, Table 10. Analytical results indicate that sample BP-05 contained TCE (240 mg/L), benzene (20 mg/L), and tetrachloroethene (PCE; 10J mg/L) above the regulatory limits of 0.5 mg/L, 0.5 mg/L, and 0.7 mg/L, respectively; other samples contained TCLP parameters within regulatory limits. On January 6, 2000, START collected sample BP-05A, which was a composite sample from treated pile 5. Analytical results indicate that sample BP-05A contained 0.180 mg/L of TCLP TCE, which is below the regulatory limit. Benzene and PCE concentrations were below detection limits.

On December 14, 1999, START collected groundwater samples GW-01 through GW-06. Samples were collected by excavating to groundwater with a trackhoe, then collecting the water in appropriate laboratory containers. Sample GW-01 was collected on the east side of the east pond, in an attempt to obtain a background sample. Sample GW-02 was collected in Area 3, at the northwest side of the east pond along the bank. Sample GW-03 was collected in an area where drums containing product were excavated in the east pond. Sample GW-04 was collected in the middle of the west

pond. Sample GW-05 was collected at the northern end of the west pond. Sample GW-06 was collected at the southwest corner of the west pond. Samples GW-02 through GW-05 contained product and an odor. Analytical results of groundwater sampling are presented in Attachment B, Table 11. Sample GW-01 contained detectable concentrations of metals and PCBs. Samples GW-02 and GW-03, collected in the east pond, contained metals, VOCs, SVOCs, and PCBs. Sample GW-02 contained 57,000 micrograms per liter ($\mu\text{g/L}$) of toluene, 5,900 $\mu\text{g/L}$ of methylene chloride, 5,515 $\mu\text{g/L}$ of naphthalene, 0.432 mg/L of lead, 358 $\mu\text{g/L}$ of total PCBs, and 3.8 mg/L of 2,4,5-trichlorophenoxyacetic acid (dilution required). Sample GW-03 contained 94,000 $\mu\text{g/L}$ of toluene, 32,000 $\mu\text{g/L}$ of xylene, 1,355 $\mu\text{g/L}$ of 2,4-dimethylphenol, 0.136 mg/L of lead, 370 $\mu\text{g/L}$ of total PCBs. Samples GW-04, GW-05 and GW-06, collected in the west pond, contained VOCs, SVOCs, and metals. Concentrations of VOCs, SVOCs, and PCBs in these samples were lower than samples GW-02 and GW-03. Sample GW-04 contained 8 $\mu\text{g/L}$ of methylene chloride, 3J $\mu\text{g/L}$ of bis (2-ethylhexyl) phthalate, 0.211 mg/L of lead, and 8.42 $\mu\text{g/L}$ of total PCBs. Sample GW-06 contained 9 $\mu\text{g/L}$ of methylene chloride, 7J $\mu\text{g/L}$ of bis (2-ethylhexyl) phthalate, and 0.385 mg/L of lead. On December 15, 1999, START collected sample Cinders-01 from a former drum staging area on top of the ridge on the west side of the east pond. Analytical results are presented in Attachment B, Table 3. The sample contained 10 mg/kg of arsenic and 60 mg/kg of lead.

On December 20, 1999, START collected samples from drums that contained labels or distinguishing marks. Sample D-200 was collected from a drum labeled Vestal. Sample D-Amchem was collected from a drum labeled Amchem Products Inc., Windsor, Ontario. Sample D-Dow was collected from a drum labeled Dow Chloroethene NU Superior Solvent, that appeared to contain paint waste. Analytical results of labeled drum samples are presented in Attachment B, Table 12. Analytical results indicate that the drums contained VOCs, SVOCs, metals, and had flashpoints below the regulatory level of 140°F. Sample D-Dow contained 120J mg/kg of TCE. The three samples contained xylene, with a maximum concentration of 5,800 mg/kg detected in sample D-Dow. The three samples contained naphthalene, with a maximum concentration of 3,110 mg/kg detected in sample D-Dow. Lead was detected in the three samples, with a maximum concentration of 18,400 mg/kg detected in sample D-Dow. PCBs were detected in the three samples with a maximum concentration of 5,042 mg/kg of total PCBs in sample D-Dow.

JANUARY 2000

By the end of the month, ER excavated approximately 1,450 drums and 9,935 cubic yards of material from the site. ER continued to excavate waste from Areas 1 and 4, and started to excavate waste from Areas 6 and 7. ER excavated approximately 737 drums and 2,560 cubic yards of material during the month. On January 13, 2000, ER investigated Area 5; however no waste material was located and excavation activities ceased.

Analytical results of blend pile samples indicated that the concentrations of RCRA-listed wastes fell below regulatory limits as defined by 40 CFR 261. The excavated

material was profiled as PCB-contaminated soil/debris. On January 5, 2000, ER began to remove wastes from site. A waste disposal summary is presented in Attachment B, Table 13. The PCB waste stream was shipped via rail car to the Safety-Kleen (Lone & Grassy Mountain), Inc. facility located in Waynoka, Oklahoma. During the course of the removal action, one hundred forty one rail cars, each containing approximately 90 tons of PCB waste, were shipped to the facility.

On January 18 and 19, 2000, START collected samples Area-04RoadA and Area-04RoadB. Sample Area-04RoadA was a composite sample collected from black, red, and white waste material excavated from the roadway in Area 4. Sample Area-04RoadB was collected from black waste excavated from the roadway in Area 4. Analytical results are presented in Attachment B, Table 14. Sample Area-04RoadA contained 25.9 mg/kg of total PCBs. Sample Area-04RoadB contained VOCs, metals, and SVOCs.

ER encountered a fibrous material in white waste approximately 3-feet below the ground surface along the west wall of the west pond (Area 4). On January 21, 2000, START collected samples A-4TA (from the north wall of the excavation) and A-4TB (from the south wall of the excavation) of the waste and fiber material. Analytical results of the samples indicated that sample A-4TA did not contain asbestos, while sample A-4TB contained 20-30% chrysotile.

On January 25, 2000, START collected two composite samples (A-4-P-1 and A-4-P-2) from waste pile 8. Waste pile 8 contained material excavated from area 4. Analytical results are presented in Attachment B, Table 15. Samples A-4-P-1 and A-4-P-2 are presented as WP-8-1 and WP-8-2, respectively. Analytical results indicate that the material excavated from area 4 contained PCBs at a concentration lower than 50 mg/kg. The remainder of the sample parameters, excluding the paint filter test, fell within regulatory limits. On February 18, 2000, START collected composite sample WP-08PF from waste pile 8 for a paint filter analysis. Sample WP-08PF passed the paint filter test. Subsequently, a low-level PCB waste stream was developed for waste pile 8. The low-level PCB waste was shipped via truck to the Milam Recycling and Disposal Facility located in East St. Louis, Illinois.

FEBRUARY 2000

All eight excavation areas were partially or fully investigated by the end of the month. Over 2,750 drums were excavated from the site by the end of February 2000. During the month, ER excavated material from Areas 6, 7, and 8. ER excavated approximately 1,017 drums and 3,040 cubic yards of waste during the month. START screened material excavated from Area 4 with several results showing PCB concentrations above 50 ppm. Selected amounts of the excavated material were staged for off-site disposal.

On February 7, 2000, START collected composite samples Waste pile-09-01 and Waste pile-09-02 from waste pile 9. Analytical results are located in Attachment B, Table 15. Samples Waste pile-09-01 and Waste pile-09-02 contained 332.0 and 218.1 mg/kg of total PCBs, respectively. The remaining sample parameters fell within

regulatory limits and waste pile 9 was added to the PCB waste stream. On February 7, 2000, START collected composite sample, Waste pile-08, from waste pile 8, which was analyzed for total VOCs, SVOCs, pesticides and target analyte list metals. The sample was collected to obtain data on parameters other than those analyzed through the TCLP method. Analytical results are presented in Attachment B, Table 6. Analytical results indicate that the sample contained VOCs, SVOCs, metals, and pesticides. The sample contained 40 $\mu\text{g/kg}$ of acetone, 13,000 $\mu\text{g/kg}$ of phenanthrene, 6,900 $\mu\text{g/kg}$ of benzo(a)pyrene, 162 mg/kg of lead, 28.5 $\mu\text{g/kg}$ of 4,4-dichlorodiphenyldichloroethylene (4,4-DDE), 16.6 $\mu\text{g/kg}$ of dieldrin, and 34.7 $\mu\text{g/kg}$ of 4,4-dichlorodiphenyldichloroethane (4,4-DDD). On February 23, 2000, START collected two composite samples, Waste pile-10-01 and Waste pile-10-2, from waste pile 10. Samples Waste pile-10-1 and Waste pile-10-2 contained 116.4 and 267.0 mg/kg of total PCBs, respectively. The remaining sample parameters fell within regulatory limits and waste pile 10 was added to the PCB waste stream.

MARCH 2000

ER completed excavation activities by the end of March 2000. A total of 3,271 drums and approximately 15,445 cubic yards of waste were excavated from the site. In March 2000, ER excavated 597 drums and 925 cubic yards of material from Area 6 and 657 drums and 620 cubic yards of waste from Area 8.

On March 1, 2000, START collected two composite samples from waste pile 11 (samples WP-11-1 and WP-11-2). Analytical results are presented in Attachment B, Table 15. Samples WP-11-1 and WP-11-2 contained 183.2 and 283.8 mg/kg of total PCBs, respectively. The remaining sample parameters fell within regulatory limits and waste pile 11 was added to the PCB waste stream.

On March 14, START collected composite samples WP-12-1 and WP-12-2 from waste pile 12. Analytical results are presented in Attachment B, Table 15. Samples WP-12-1 and WP-12-2 contained 34.0 and 34.3 mg/kg of total PCBs, respectively. The remaining sample parameters fell within regulatory limits and waste pile 12 was added to the low-level PCB waste stream. During the course of the removal action approximately 3,260 tons low-level PCB waste was removed from site.

APRIL 2000

On April 13, 2000, the U.S. EPA Fields Team mapped site features using a global positioning system. Maps generated by the team are presented in Attachment A. On April 5 and 6, 2000, ERRS removed surface soil, gravel, and the lining from Alton Southern property used to transfer and stage site wastes for disposal. The excavated soil, gravel, and liner was placed into rail cars for disposal or moved on site. On April 18 and 19, 2000, ERRS seeded and placed straw bales in the former excavation areas to provide vegetative cover and to reduce erosion.

On April 10, 2000, START collected seven composite surface soil samples (RS-01A through RS-07A) on areas impacted by the transfer of site wastes. Sample locations are

presented in Attachment A and sample results are presented in Attachment B, Table 7. On April 10, 2000, START sampled the railroad property mirroring the methodology of samples collected prior to waste transportation through the railroad property. Analytical results indicate that levels do not differ significantly from the original samples (RS-01 through RS-07) collected on December 21, 1999.

April 13 and 17, 2000, START collected 24 subsurface soil samples in former excavation areas to determine concentrations of PCBs that remain in soils. Samples were collected below cover material in areas where drums and/or bulk wastes were removed. A description of samples, sample depths, and sample material is presented in Attachment B, Table 16. Attachment A contains a map showing sample locations and a map showing removal areas in conjunction with sample locations. Analytical results are presented in Attachment B, Table 17. Samples collected in Areas 1 and 2, and samples A3-01 and A3-02 were collected from the bottom of the east pond. These samples, except for sample A2-01, contained concentrations of total PCBs greater than 50 mg/kg. A maximum of 330 mg/kg of total PCBs was detected in sample A1-01. Samples A3-03, A6-01, and A8-01 contained levels of PCBs greater than 50 mg/kg. Samples A6-01 and A8-01 were collected in borings that contained foreign material. Analytical results indicate that concentrations of PCBs in site soils exceed the removal action limit of 50 ppm.

On April 18 and 19, 2000, ER spread seed and placed straw bales and silt fencing on capped areas to prevent erosion. During the week of April 17, 2000, U.S. EPA, ER, EQM, and START demobilized from site. Due to lack of topsoil needed to completely cap the excavation areas, municipal waste is visible on the limited portions of the site. Due to limited resources, the site contains drums protruding from the ground and additional areas of contamination.

2. Treatment, disposal, or alternative technology approaches pursued

Approximately 13,772 tons of PCB contaminated soil and debris, 3,260 tons of low level PCB waste, and 3,271 drums were excavated and removed from site. 5,400 tons of the PCB-contaminated soil were treated on site with Enviroblend to bind leachable lead. The PCB waste was disposed at the Safety-Kleen (Lone & Grassy Mountain), Inc. facility located in Waynoka, Oklahoma, while the low-level PCB waste stream was disposed at the Milam Recycling and Disposal Facility located in East St. Louis, Illinois. A waste disposal summary is included in Attachment B, Table 13.

3. Public information and community relations activities

Throughout the removal action, OSC Turner met with various public officials and private citizens. OSC Turner attended several "town hall" type meetings in Cahokia to give updates in the removal action and answer questions. OSC Turner and other U.S. EPA representatives conducted interviews with various news media to assist with publications on site activities.

E. Resources Committed

Extramural Costs:

Total Cleanup Contractor (e.g, ERRS) Costs	\$2,100,000
START	\$66,780
TOTAL, EXTRAMURAL COSTS	\$2,166,780

Intramural Costs:

Direct Costs (Region, HQ, ERT)	\$51,000
Intramural Indirect Costs	\$0
TOTAL, INTRAMURAL COSTS	\$51,000

TOTAL SITE COST	<u>\$2,217,780</u>
Project Ceiling	<u>\$2,400,000</u>

Any indication of specific costs incurred at the site is only an approximation, subject to audit and final definization by U.S. EPA. The OSC Report is not meant to be a final reconciliation of costs associated with a particular site.

II. EFFECTIVENESS OF REMOVAL ACTIVITIES

A. Actions Taken by PRPs

During the course of the removal action, a consultant for Eagle Marine Industries, Inc. visited the site to discuss site activities with OSC Turner.

B. Actions by State and Local Agencies

Illinois EPA provided historical information on the site. Illinois EPA representatives spoke with OSC Turner regarding technical details of the removal activities.

C. Actions Taken by Federal Agencies and Special Teams

U.S. EPA provided monetary resources, overall response organization, and oversight during all removal activities conducted by ERRS. The United States Coast Guard Atlantic Strike Team provided oversight of activities on several occasions during the removal action. U.S. Fish and Wildlife Service, as a natural resource trustee, visited the site and spoke with OSC Turner.

D. Actions Taken by Contractors, Private Groups, and Volunteers

The U.S. EPA ERRS contractor, Environmental Quality Management provided the subcontractor, Environmental Restoration, who conducted the removal of waste materials at Site Q. Environmental Restoration excavated bulk waste, drums, and contaminated soil; staged waste; assisted with sampling; assisted with the organization of the response; backfilled excavation areas; and graded/seeded former excavation areas. Environmental Quality Management provided subcontractors to analyze samples and transport and dispose of site wastes. Environmental Restoration provided the personnel and equipment necessary to complete field operations.

U.S. EPA START contractor, E & E, provided continuous assistance in documenting on-site activities and costs incurred; conducted contractor oversight (both general and health and safety); completed air monitoring; conducted soil, product, and groundwater sampling; and completed necessary reports.

III. DIFFICULTIES ENCOUNTERED

A. Items That Affected the Response

Transportation: Rail cars provided a quick and efficient means of removing contaminated material off-site.

Amount of contamination: After the removal action was completed, levels of PCBs in site soils still exceed removal action limits.

B. Issues of Intergovernmental Coordination

Not applicable.

C. Difficulties Interpreting, Complying With, or Implementing Policies and Regulations

Not applicable.

IV. RECOMMENDATIONS FOR NEW POLICY OR REGULATIONS, AND CHANGES IN CURRENT REGULATIONS AND RESPONSE PLANS

A. Means to Prevent a Recurrence of the Discharge or Release

Routine audits: Audits should be conducted routinely for companies that are producers or users of large quantities of hazardous substances, and these companies should be required to dispose of wastes produced and materials used. Companies that fall into these categories could be required to carry and maintain liability insurance to pay for potential environmental damage or threats that result from operations.

B. Means to Improve Removal Activities

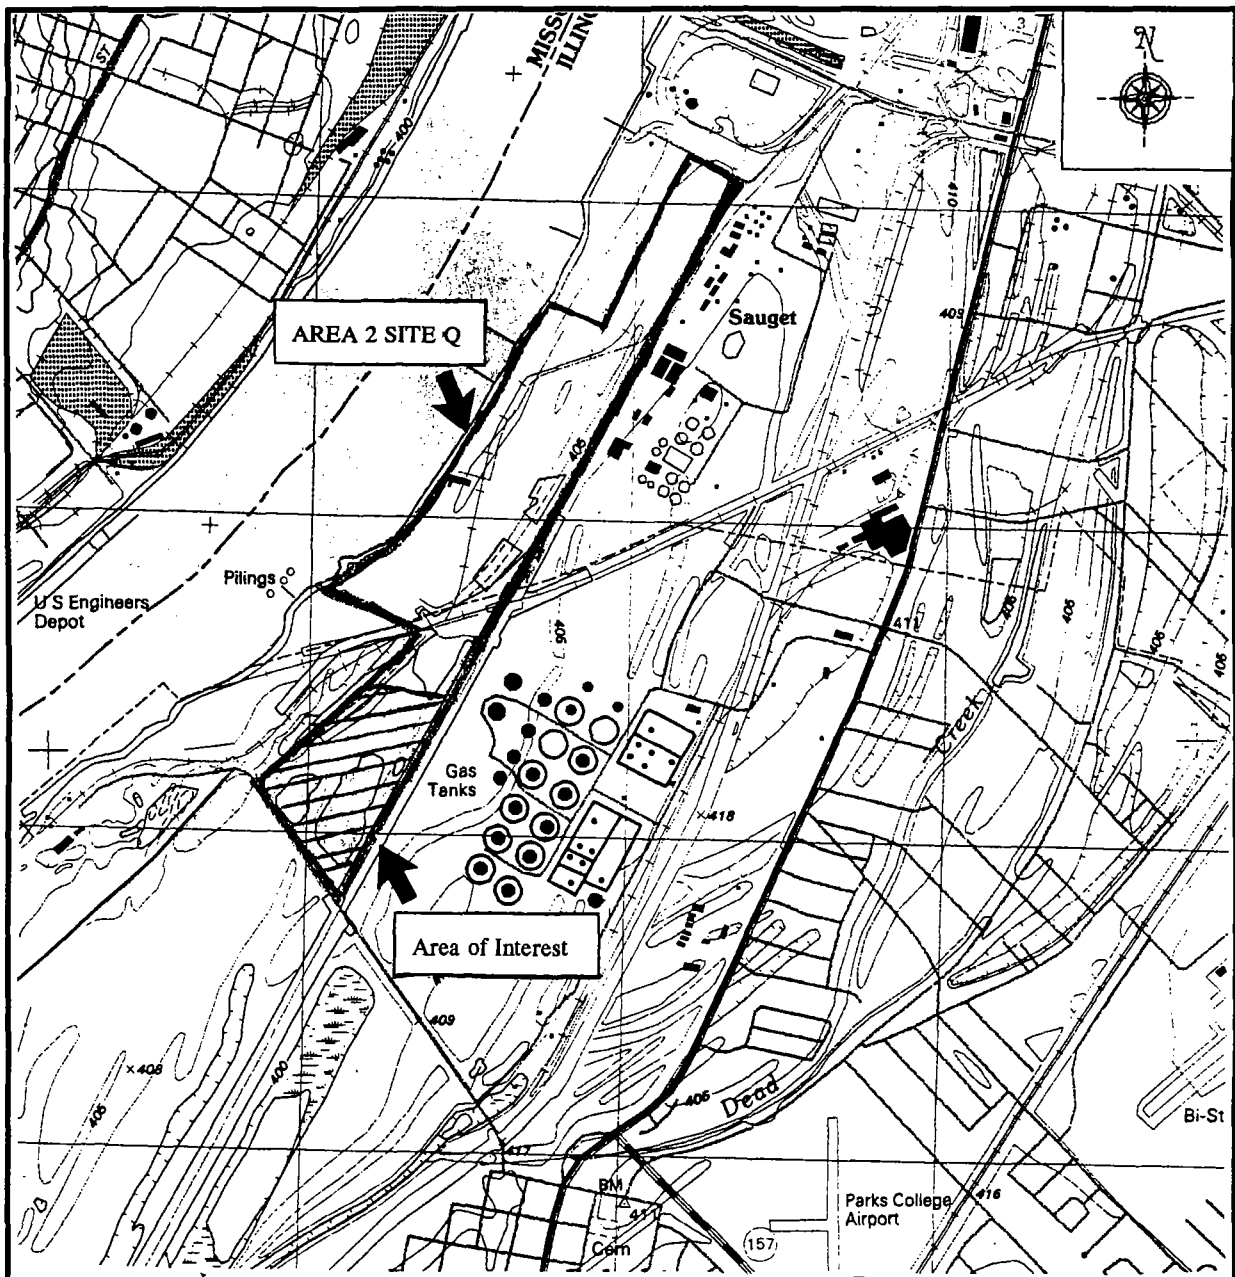

None.

C. Recommendations for New Policy or Regulations, and Changes in Current Regulations and Response Plans

None.

Key: n.o.s. = Not otherwise specified.

Safety-Kleen: Safety-Kleen (Lone & Grassy Mountain), Inc.,
5 M E and 1 M N of Junction Highway 281 & 412
Waynoka, OK 73860
U.S. EPA ID: OKD065438376
Shipped via rail car.

Milam RDF: Milam Recycling and Disposal
601 Madison Road
East St. Louis, IL 62201
U.S. EPA ID: Not available
Illinois EPA ID: 1630450001
Shipped via truck.

Site Q generator ID: ILD000605790
